Year 4	Science	States of Matter

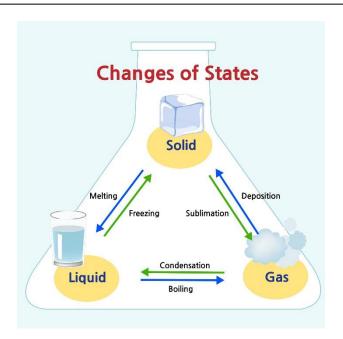

Matter makes up our physical universe. In primary school, pupils learn about the matter on Earth, which exists in one of three states: solid, liquid or gas.

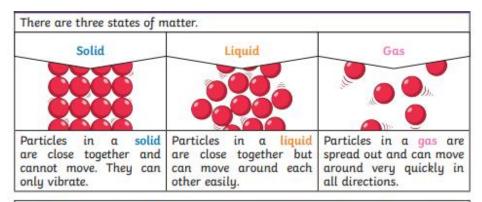

In Year 4, children will learn:

- To group or sort materials into solids, liquids and gases.
- To observe that some materials change state when heated or cooled.
- To understand and use the terms evaporation and condensation.
- To describe solids, liquids and gases.

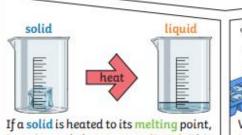

Pupils will work scientifically by:

- Grouping and classifying a variety of different materials.
- Exploring the effect of temperature on substances.
- Researching the temperature at which materials change state.
- Observing and recording evaporation over a period, such as a puddle in the playground.
- Investigating the effect of temperature.

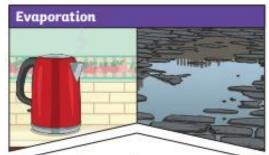

When water and other liquids reach a certain temperature, they change state into a solid or a gas. The temperatures that these changes happen at are called the boiling, melting or freezing point.

it melts and changes to a liquid. This is because the particles start to move faster and faster until they are able to move over and around each other.

When freezing occurs, the particles in the liquid begin to slow down as they get colder and colder. They can then only move gently on the spot, giving them a solid structure.

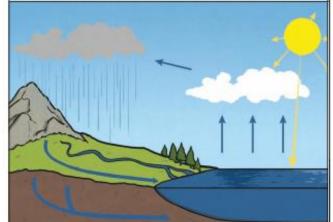

Evaporation occurs
when water turns into water vapour.
This happens very quickly when the
water is hot, like in a kettle, but
it can also happen slowly, like a
puddle evaporating in the warm air.

when water vapour is cooled down and turns into water. You can see this when droplets of water form on a window. The water vapour in the air cools when it touches the cold surface.

Condensation and evaporation occur within the water cycle.

- Water from lakes, puddles, rivers and seas is evaporated by the sun's heat, turning it into water vapour.
- This water vapour rises, then cools down to form water droplets in clouds (condensation).
- When the droplets get too heavy, they fall back to the earth as rain, sleet, hail or snow (precipitation).

Key Vocabulary	
states of matter	Materials can be one of three states: solids, liquids or gases. Some materials can change from one state to another and back again.
solids	These are materials that keep their shape unless a force is applied to them. They can be hard, soft or even squashy. Solids take up the same amount of space no matter what has happened to them.
liquids	Liquids take the shape of their container. They can change shape but do not change the amount of space they take up. They can flow or be poured.
gases	Gases can spread out to completely fill the container or room they are in. They do not have any fixed shape but they do have a mass.
water vapour	This is water that takes the form of a gas. When water is boiled, it evaporates into a water vapour.

melt	This is when a solid changes to a liquid.
freeze	Liquid turns to a solid during the freezing process.
evaporate	Turn a liquid into a gas.
condense	Turn a gas into a liquid.
precipitation	Liquid or solid particles that fall from a cloud as rain, sleet, hail or snow.
